Social Consequences and Effects of RFID Implants?

Posted by [Cliff](#) on Wednesday May 03, @11:45PM
from the [chips-in-my-head](#) dept.

[kramdam](#) asks: "Even with all the talk about privacy and security, there seems to be a growing community of people who are implanting themselves with RFID chips. Being a developer myself, I am intrigued about building applications and solutions that will open my doors, unlock my car, log me on to my computer and control home automation. I'm seriously considering jumping into this head first, being on the bleeding edge, and going with an implant. I have looked at resources like [Mikey Sklar's](#) site, and [Amal Graafstra's](#) site, since they are two pioneers on this subject. For research, I have started [TaggedLife](#) to document my own journey. I was wondering what the Slashdot community think about this. What do you think are the social, security, privacy, and health risks associated with this? What are the pluses? Would you do it?"

I am however worried about ubiquitous tracking. How can that possible be good? Britain for example wants to track EVERY car on the roads and then store the data for 2 years.

"Britain is to become the first country in the world where the movements of all vehicles on the roads are recorded. A new national surveillance system will hold the records for at least two years.

Using a network of cameras that can automatically read every passing number plate, the plan is to build a huge database of vehicle movements so that the police and security services can analyse any journey a driver has made over several years."

Inplantable RFID tags are just not for me. Sounds a little to, well, end-times-ish. I would rather have an RFID watch or something. Sure, it could be stolen, but what about a central control website where if it was stolen, I just deactivate the code from it and put in the code for my new watch. Problem solved.

Since it seems security devices are always being compromised, I'd hate to have to cut myself open every time one of these things had been likewise compromised.

I agree - an RFID watch would be much better - perhaps an RFID watch that can identify the person wearing it biometrically, even.

Steve

*You *already* need to take yourself apart to foil biometric ID.*

Well the last time I had imprints/samples of any body-bits taken without my will or knowledge was, oh, never. Nobody hiding in an alley that I'm passing by is getting a good picture of my retina to forge. I don't believe any strangers I may have shook hands with were surreptitiously taking my fingerprints either. With an embedded RFID tag, you could be being positively identified at any time with a very minimal risk of the snooper being detected by you. With remote access, everything is right there for anyone with the right kind of snooping equipment. That's why they had to shield the covers of those RFID passports they came out with, so I guess one would have to put the thing in their wrist and then wear a shielded glove or wristband all the time to protect their privacy. Kind of defeats the purpose of the convenience, if one is at all privacy-minded.

There are no real advantages to such a scheme and **plenty** of disadvantages. For example:

- As soon as the technology improves, you have to get surgery to replace it with one that isn't spoofable.
- There's the possibility of infection or other negative reaction to the device.
- We have no idea what the long-term impact of these devices inside the human body could be.
- And of course, there's the big one: instead of stealing someone's wallet to steal money from them, thieves will now start cutting off someone's hand---sort of a reverse medieval thing.

Indeed, for me---and apologies in advance for my language---I believe the answer is not so much "no", but rather, "hell fucking no."

Exactly. For some reason most people here seem to forget the most important thing:

RFID has nothing to do with encryption/security. It's a serial number. What fucking good is that going to do you? So your car will start when your serial number is near? It should be pretty clear that faking a serial number is trivial. With RFIDs you don't even need physical contact to achieve that.

In other words:

I am intrigued about building applications and solutions that will open my doors, unlock my car, log me on to my computer and control home automation

will not be solved by RFID. I don't even understand where someone would get that idea. You'd be crazy to rely on that. If you think that doing security through positive identification of a certain physical human being present is a good idea (which is debatable to begin with), then you're probably better off doing fingerprint or iris-scanning.

Now if RFID tags had RSA or something built in, it would be a different story. But they don't.

Eh, this whole story makes no sense at all.

The car and computer thing are both daft, but the home automation goal has some merit. If you have a house where more than one person lives, having a home automation system that can track the movements of each person individually would be a major boon. Most current attempts at home automation are based around whether *someone* is in a room, rather than tailoring to each person.

Of course, you could ask what it would do when two people with conflicting preferences are in the same room, but that's just a software problem and is thus much easier to refine over time.

You are correct that keys (in the case of, say, a door or car) are adequate security in many cases. If you need better security, use a "thieves lock" (it actually unlocks in the reverse direction than normal, with the normal direction causing the lock to disable itself until reset).

However, let's assume that this person WANTS the most high-tech solution imaginable. RFID tags are dumb devices with no meaningful logic, which means you can't do encryption key negotiation - or, indeed, any form of encryption at all. Anyone with a scanner can lift ALL of your keys with a simple RFID reader and can then impersonate you with impunity with ALL electronic devices.

If someone wants an implant - genuinely, truthfully, absolutely would die without one - then they should implant an intelligent device, preferably a small embedded general purpose computer. General purpose? Yes, then you only need one implant, which you can then program for ALL of your devices you want to control, rather than having one implant per device.

Strong, crypto would utterly defeat the RFID attack on cars mentioned in an earlier Slashdot story. It would also make the computer "unscannable" the way an RFID tag is, because it's no longer just a passive device. Further, an intelligent device could do ANYTHING you wanted, whereas an RFID tag could not. An embedded computer could monitor your temperature and control the thermostat accordingly, for example. An embedded tag could do nothing more than get crushed as the blood vessels expanded.

Personally, I would avoid implants. Implants can be thought of as deliberate splinters or deliberate cysts, depending on size. Both of these, when they occur naturally, can potentially turn nasty. The body really doesn't take kindly to foreign objects, if it detects them. When you've any kind of device that was probably not assembled in a clean-room environment, sterilized and completely censed, there's a good risk that implants could carry unwanted hitchhikers. Even when it's all done properly, a good bruise near the implant could turn nasty. That's ignoring any chemical reactions between the implant and the body, which may have other unexpected consequences.

(You should also be aware of materials used. Materials that have a higher-than-normal level of alpha-particle emitters could seriously screw things up. The skin is thick enough to absorb alpha particles, in typical real-world conditions, which is just as well - soft tissue tends not to react too well to such things.)

The embedded computer shares ALL of the health problems of an RFID tag, though scaled up because it is more complex and involves more components. It also needs a power source, so you'll occasionally need to rip yourself open to replace the lithium batteries.

Now, there ARE ways to embed a computer in a person in a way that would minimize hazards on a day-to-day basis. However, there you're talking major surgery for the implant plus for each recharge. Surgery is, itself, extremely dangerous and not something you'd normally do just to add a gadget to your life.

It's possible to imagine surgical implants that COULD be recharged with less effort - such as enlarging the skull and using some of the space added, with a power outlet the bone can grow around - but we're talking serious sci-fi medical techniques here. Sure, there have been experiments involving wiring EEG devices directly to the human brain. Sure, even Stone Age medics could drill holes large enough to run a power outlet or an ethernet port. Sure, there are societies even today that deliberately reshape the skull. But to combine all of this AND enlarge an adult skull, not just reshape a child's... That is probably too complex for existing technology.

However, were implants to be a useful thing for society as a whole, a deep implant (such as in the chest cavity - if you can staple a stomach in half safely, you can wedge a matchbox-sized motherboard in there with absolutely zero impa

I certainly won't even consider it. Nazi Germany comes to mind, marking folks for reasons of ID'ing them for whatever reason is not a good idea. SS is another thing that creeps me out, a system of identification, now illegally used all the time to limit people's freedoms. Business all the time limit doing business with someone if they don't provide a SS, yet that is illegal. When will it come down to the same with a RFID? I suspect sooner than later, especially if the government gets involved in the process, and it already has... FDA anyone?

That's right. Implanting the RFID tag robs you of the option of leaving it home when you really don't care to have it around and be trackable, unless your real intention is to explore the psychological implications of being robbed of that choice and having to learn to live with yet another freedom abridged (by free will, no less... how twisted is that?)

...solutions that will open my doors...

You mean like to your home? How is this secure? I mean, truly, how? What your RFID only will respond to certain readers? Someone won't be able to have a portable reader connected to say a laptop that reads your RFID and uses that to program the correct response code to other readers?

...unlock my car...

I take it you didn't read the LA Times lately. For reference, go read [this article](#) [latimes.com] and when you are done, do you REALLY think they won't be able to do something similar? In fact it will be even easier, they just watch a place that gets a lot of expensive cars, place a few RFID readers around, wait for you to leave and then walk up to your car and drive away. They wouldn't even need to spend several minutes "cracking" your car's code since they got it from you when you drove into the lot.

...log me on to my computer...

Get a fingerprint reader, or a smart card reader. Heck Sun has an entire system based on this for years, it will even move your active session from computer to computer (i.e. the applications you have open and running, your connections to other computers, the mozilla window on slashdot, the code you have compiling, etc...)

...control home automation...

Wow, you need to have a RFID "implanted" to do this? Why not a card or a chip, or widget that fits in your wallet? Why not that for ANY of the above? All you do with the implant is tag yourself for everyone else to see and track. A card/chip/widget can be easily changed. Same reason why you need to change passwords ever few weeks, it make it harder for someone to compromise and continue compromising your security.

Last I saw, you could get these the size of a grain of rice. Why not just pierce your ear and stick it in the hole, or superglue it to your fingernail (which you'd have to redo periodically)

Here's a reason no one thought of for these... If there's any ferrous metal in the device, you cannot go into an MRI machine. Additionally, even though there may not be ferrous metal in it, the MRI can still cause inductive heating on the device which can burn you. This is fine, when you're coherent enough to tell the docs what you have. What happens if you are in a car accident or have a stroke, and they need to stick you in an MRI machine?

RFID = 666?

(Score:5, Funny)

by [DinoPirate5000 \(972725\)](#) on Thursday May 04, @04:05AM ([#15260576](#))

there are some people who believe RFID chips are the mark of the beast. and it almost fits for the most part: And he causeth all, both small and great, rich and poor, free and bond, to receive a MARK in their right hand, or in their foreheads: And that no man might buy or sell, save he that had the MARK, or the name of the beast, or the number of his name. Here is wisdom. Let him that hath understanding count the number of the beast: for it is the number of a man; and his number is Six hundred threescore and six. Rev. 13:16-18 although it also mentions that you can also name the beast or know his number, so I don't know how accurate this is, but I've read about a computer system that stores all kinds of information from bar codes and stuff named Bavarian Economic Accounting Statistics Terminal (B.E.A.S.T. for short) There are a few other tie ins such as the bible mentions those wearing the mark will have blisters and sores on the skin where the mark is. This is possibly caused by the body rejecting the RFID chip. I know it may sound alittle crazy, but just think about it before you put these in your skin, don't wanna unleash the wrath of God on yourself because you didn't heed a fellow slashdotter's warning ;-)

Nothing to hide? May we install cameras in your bedroom and bathroom?

You did say nothing, right?
